

HazardOS — AHS Evaluation Access

Here's everything you need to get into HazardOS and have a look around.

Web address: <https://hazardos.app>

The app works in any modern browser, on desktop and on a phone. There's nothing to install, though on a phone you can add it to your home screen and it'll behave like a normal app (useful if you want to try the field side of things).

Before you start

This is a sandbox, not your live system. It's loaded with a fictional abatement company's data so there's something to look at on every screen. Poke at it however you like, change things, delete things, break things. We rebuild it with one command.

Two things to know:

- **Please don't enter real customer information.** Names, addresses, phone numbers, anything from an actual job. This environment gets deleted once you're done with it, and we'd rather your real data went straight into your own system instead.
- **Nothing you do here carries over.** When you're ready to start working for real, we'll set up your own organisation from scratch with your branding, your team, your pricing.

Your logins

Every login below uses the same password:

AhsPreview-2026!

We've set up seven accounts so you can see how the app changes depending on who's signed in. A technician on a phone in a crawlspace should not see the same thing an owner sees at a desk, and the quickest way to understand that is to sign in as both.

ROLE	EMAIL	WHAT THIS PERSON CAN DO
Owner	mark.hope+ahs-owner@asymmetric.pro	Everything, including settings, billing, and adding or removing staff
Office manager	mark.hope+ahs-admin@asymmetric.pro	Full day-to-day access across the CRM, jobs and invoicing, and can manage the team
Estimator	mark.hope+ahs-estimator1@asymmetric.pro	Surveys, estimates and proposals; works the sales pipeline
Estimator (2nd)	mark.hope+ahs-estimator2@asymmetric.pro	Same as above, so you can see how work splits between two estimators

Technician	<code>mark.hope+ahs-tech1@asymmetric.pro</code>	Field view: assigned jobs, site surveys, photo capture
Technician (2nd)	<code>mark.hope+ahs-tech2@asymmetric.pro</code>	Same as above
Read-only	<code>mark.hope+ahs-viewer@asymmetric.pro</code>	Can see the work but can't change anything

Start with the **Owner** login. It sees the whole picture, and the rest will make more sense once you've got the shape of it.

The email addresses point at our inbox rather than yours. That's deliberate for a trial account, so nothing the system sends lands on your staff unexpectedly. If a screen asks you to confirm an email or reset a password, tell us and we'll sort it.

What's already in there

The sandbox is pre-loaded with a complete run of work, so you can follow a job from first phone call through to getting paid:

- A handful of commercial accounts and the contacts attached to them
- An active sales pipeline with opportunities at different stages
- Site surveys, including ones with field photos attached
- Estimates built off those surveys, and proposals sent to the customer
- Scheduled and completed jobs
- Invoices, some paid, some outstanding

Worth looking at

If you've only got twenty minutes, these are the parts we'd most like your opinion on:

The CRM. It's the first tab and it's meant to be where your day starts. Contacts, companies, opportunities, and a drag-and-drop pipeline board.

A survey through to an invoice. Open a completed job and work backwards through the estimate and the survey it came from. The question we care about is whether that chain matches how you actually quote work.

The phone experience. Sign in as a technician on your mobile and open a site survey. This is the piece that's hardest to get right and where your field staff's opinion matters more than ours.

Anything that feels wrong. Terminology that isn't what you'd say, steps in an order that doesn't match your process, a field you'd never fill in, something obviously missing. That's the most useful feedback there is and it's much cheaper to change now than later.

When something breaks

It might. Tell us what you were doing when it happened and roughly when, and we can find it in the logs. Screenshots help but aren't essential.
