

HazardOS User Manual

For everyone who uses HazardOS day to day: office staff, estimators, project managers, and field technicians.

If you administer the system (adding people, setting prices, configuring messaging), see the **HazardOS Admin Manual** instead. This manual covers doing the work, not configuring it.

Last updated 19 August 2026.

1. Getting started

Signing in

Go to your company's HazardOS address and sign in with your work email and password. If you've forgotten your password, use **Forgot password** on the sign-in screen and follow the emailed link.

If you were invited by an administrator, your invitation email contains a link that lets you set your own password. Invitations expire, so if yours no longer works, ask your administrator to send a new one.

Your profile

Settings → **Profile** holds your name, contact details, and notification preferences. Keeping your name accurate matters more than it looks: it appears on estimates you build, jobs you're assigned to, and timesheets your supervisor approves.

On your phone

HazardOS installs to a phone or tablet home screen like an app. There is no App Store download: it installs from the browser, and updates arrive on their own.

- **iPhone or iPad:** open HazardOS in Safari, tap **Share**, then **Add to Home Screen**. Safari never shows an install banner, so this is the only route.
- **Android:** open HazardOS in Chrome and take the **Install** banner when it appears. If it doesn't, use the three-dot menu and choose **Install app**.

This matters for field work, because the mobile survey tool is built for one-handed use on site and keeps working with no signal. Working from a desk? There's nothing to install. Use the browser.

2. Finding your way around

The main navigation runs across the top. What you see depends on your role, so your menu may be shorter than a colleague's.

SECTION	WHAT IT'S FOR
Dashboard	Your overview: what's happening today and what needs attention
My Work	Everything assigned to you, in one list
Time Clock	Clocking in and out, and submitting your week
CRM	Properties, contacts, companies, opportunities, pipeline, jobs
Surveys	Site surveys, scheduled and completed
Lab Reports	Sample results and the reports that come back
Estimates	Building and sending estimates and proposals
Jobs	Scheduled and active work
Work Orders	The paperwork crews take to site
Compliance	Regulatory notifications, permits, and credentials
Invoices	Billing and payment tracking
Sales	Commissions, approvals, win/loss analysis
Calendar	Scheduled surveys, jobs, and appointments

Feedback	Customer satisfaction responses
-----------------	---------------------------------

The CRM is its own space

When you open the CRM, the main menu is replaced by CRM tabs: Properties, Contacts, Companies, Opportunities, Pipeline, Jobs, and Calendar. Use **Main Menu** to come back out. This trips people up the first time, so if the top of the screen looks unfamiliar, check whether you're inside the CRM.

3. What your role can see

HazardOS has seven roles. Yours determines both what appears in your menu and what you can open directly.

ROLE	TYPICALLY	CAN SEE MONEY?
Tenant Owner	The business owner	Yes
Admin	Office manager, operations lead	Yes
Estimator	Sales and estimating staff	Yes
Viewer	Read-only office staff, bookkeeping	Yes, read-only
Technician	Field crew	No
Platform Owner / Platform Admin	HazardOS support staff	Yes

A note for technicians

Technicians do not see money anywhere in the system. Estimates, invoices, contract values, job costs, material costs, and margin are all hidden. This is deliberate and was requested by the business: the field crew works the job, and what it's worth is not part of that job.

You'll still see everything you need: your assigned work, job details, hazards, containment requirements, site contacts, photos, and your own hours. If you believe you're missing something you need to do your job, tell your administrator rather than working around it.

A note for viewers

Viewers can read financial screens but cannot change anything. Buttons that create, edit, or delete are not shown, and the system refuses those actions even if reached another way.

4. Dashboard and My Work

Dashboard is the overview: what's scheduled, what's overdue, and what needs a decision. It's the sensible first stop each morning.

My Work is narrower and more useful once the day starts. It lists what is assigned specifically to you across surveys, jobs, and follow-up tasks, so you don't have to check several screens to find your own work.

5. Time Clock

Clocking in

Open **Time Clock** and choose what you're working on:

- **General time (no job)** for anything not tied to a specific job: shop time, travel between sites, meetings.
- **A specific job** from the dropdown, which lists scheduled and in-progress jobs.

Press **Clock In**. The screen then shows a running total and a **Clock Out** button.

You can only have one clock running at a time. If you try to clock in while already clocked in, the system stops you and tells you to clock out first. This is deliberate: it's easy to double-clock on a phone in a work glove, and the resulting timesheet is worse than the inconvenience.

Clocking out

Press **Clock Out**. The entry moves into **This Week** with its total.

Submitting your week

Once everything for the week is clocked out, press **Submit Week**. This sends your hours to your supervisor for approval.

Submit Week stays disabled while any entry is still running. Submitting a week with a live clock would freeze a total that's still changing, so clock out of everything first.

After submitting, entries show as **submitted** until your supervisor reviews them. Approved entries show as **approved**. If something is sent back, it shows as **rejected** with your supervisor's note explaining why, and you can correct and resubmit.

Approving time (supervisors)

If your role allows it, an **Approve Time** button appears at the top of the Time Clock screen. It opens the approvals queue, grouped by person, where you can approve or reject submitted entries in a batch. Rejections take a note, and the technician sees it.

Technicians cannot approve their own hours. The system enforces this at the database, not just by hiding the button.

6. The CRM

The CRM holds everyone and everything you sell to.

Properties

Physical sites. Because remediation work is tied to buildings rather than people, a property can outlive any particular owner or contact and carry its own history of surveys, hazards, and jobs.

Contacts

People. Each contact is either **residential** or **commercial**, and carries a role such as decision maker, billing contact, or site contact. Contacts hold phone numbers, a preferred contact method, and email and SMS consent flags.

Consent matters. If a contact hasn't opted into SMS, the system will not text them, and no amount of clicking Send will change that. The same applies to marketing email.

Companies

Business accounts: contractors, property management firms, HOAs, government bodies. A company can have many contacts.

Companies are created through the commercial contact flow rather than on their own. If you need a new company, start by adding the commercial contact who works there.

Opportunities

Potential work. An opportunity records the hazard types involved, the property type and age, urgency (routine, urgent, or emergency), any regulatory trigger, and an estimated value with a probability.

Urgency is worth setting honestly. Emergency work is scheduled differently, and an inbox where everything is an emergency helps nobody.

Pipeline

The Kanban board view of opportunities. Drag a card between columns to move the work along. Columns are configured by your administrator to match how your business actually sells.

Jobs

Won work, scheduled and tracked. See [Jobs and Work Orders](#).

How it all connects

Source information carries forward automatically. Where a contact came from is inherited by the opportunity created for them, and then by the job created from that opportunity, so you can see which marketing actually produced paid work without re-entering anything.

7. Site Surveys

Scheduling a survey

From **Surveys**, choose **Schedule Site Survey**. The form asks for the customer, the site address, and the **hazard type** being investigated.

You don't need an existing customer. The contact picker has an **Add New Contact** option that creates the contact inline, so a phone call can become a scheduled survey without leaving the screen.

Quick Add Appointment

When someone calls and you just need it in the diary, use **Quick Add Appointment**. It asks for four things only: name, address, hazard type, and email. It creates a draft survey you can finish scheduling later from the survey list.

Use this when you're on the phone and detail can wait. Use the full scheduling form when you have the information to hand.

Doing the survey on site

Open **Surveys** → **Mobile** on your phone or tablet. The wizard walks through six sections:

1. **Property:** address, building type, year built, size, stories, construction type, occupancy, and an optional owner contact
2. **Access:** restrictions, parking, equipment access
3. **Environment:** conditions affecting the work
4. **Areas & Hazards:** the areas you document and what you find in each
5. **Photos & Videos:** site media
6. **Review:** a completion checklist and submit

Environment and Photos are optional. Leaving either blank will not stop you submitting. They appear in the completion checklist so you can see what you skipped, but they don't block the survey. This was changed in response to customer feedback: crews were being stopped from filing a survey by sections that didn't apply to the work in front of them.

What *does* block submission is the information the office genuinely needs: Property (address, state, building type), Access, and at least one documented area under Areas & Hazards. The review screen lists exactly what's missing and lets you tap through to fix it.

The **Save** button in the header saves progress at any point, so an interrupted survey isn't lost.

Photos

Photos upload in the background as you take them. The Next button waits if uploads are still in flight on the photo step, so give it a moment on a weak signal rather than forcing it.

8. Lab Reports

Where sample results live. Create a lab report against a survey or job, record what was sampled, and attach the result when the laboratory returns it. Each report gets a reference number automatically.

Lab results feed compliance, and depending on your configuration a returned result can trigger follow-up work automatically.

9. Estimates and Proposals

Estimators, admins, owners, and viewers. Technicians don't see this section.

Building an estimate

From **Estimates** → **New**, choose the customer and survey, then add line items. Line items draw on the pricing your administrator configured (labor, equipment, materials, disposal, travel), so rates stay consistent between estimators.

Markup, discount, and tax apply at the estimate level and the totals recalculate as you change them.

Versions

Estimates are versioned. When you revise a sent estimate, HazardOS creates a new version rather than overwriting the old one, so what the customer originally saw is preserved.

The estimate header shows **Version X of Y**, and a **Version History** panel lists the chain. Exactly one version in a chain is the **active** one, which is the version the rest of the system treats as current. Use **Mark active** to switch, and when you're viewing an older version a banner tells you it isn't the active one.

Practical advice: revise rather than edit once anything has gone to the customer. The version history is what protects you in a disagreement about what was quoted.

Sending a proposal

From an estimate, generate and send the proposal. The customer receives a link to a page where they can read and sign it. See [What your customers see](#).

10. Jobs and Work Orders

Creating a job

Jobs are created from won opportunities, which carries the customer, property, and hazard details forward automatically.

The job record

A job holds:

- **Schedule and crew:** dates and who's assigned
- **Hazards and containment:** hazard types and the OSHA containment level (Type I, II, or III)
- **Permits and manifests:** permit numbers and disposal manifest numbers
- **Air monitoring and clearance testing:** whether each is required
- **Documents:** everything filed against the job
- **Notes and activity:** the running history

Assigning crew

Assign Crew on the job's Crew tab. Check off everyone who's going, pick the role they'll all carry, and name a supervisor.

The supervisor list covers your whole team, not only the people you just checked off. The handful of people who normally run work are always in it, and so is everyone else, for the occasional job where somebody runs a crew who usually doesn't. If you name someone you didn't check off, they're added to the job for you rather than the designation landing on nobody.

Whoever you name carries the Supervisor role on the job, so the crew list shows who was in charge without anyone having to remember.

If a credential the job requires has lapsed, you'll be warned before you assign, and depending on how your administrator set it up the assignment may be refused outright.

Work orders

Generate Work Order produces the document the crew takes to site: scope, hazards, containment requirements, site contact, and access notes.

It's created as a draft, and it takes a snapshot of the job as it stands, so later edits to the job don't quietly rewrite paperwork a crew is already carrying. Before you issue it, you can correct any section:

- **Crew:** pick people from your team, or choose *Someone else* and type a name for a subcontractor or a temp. Tick **Supervisor** for whoever is running it.
- **Materials and equipment:** taken from the approved estimate's line items.
- **Vehicles:** what's going, who's driving, and rental details if it's hired.
- **Extra items:** anything else the crew needs to know about.

Issue it once it's final. You can download it as a PDF or email it straight to the crew.

Occupant Protection Plan (OPP)

The Wisconsin DHS form, required where occupants stay in the building during the work.

Open the job's **Documents** tab and click **Generate OPP**. The wizard fills in what it can: your company details, the property, the schedule, and the protective-measures wording your administrator set up once in Settings.

Check the project description before you save. The form asks for the type and the amount of material being removed or disturbed, and that's the part an inspector actually reads. HazardOS takes it from the proposal's scope of work, so on a job with a proposal behind it you should find your own wording already

sitting there:

Removal and disposal of approximately 225 sq feet of asbestos containing two layers of sheet vinyl in the lower level kitchen. 15' x 15', on a plywood underlayment.

Underneath the box, the wizard tells you where that text came from. If the job has no proposal behind it, it says so and asks you to type the quantity and the material in yourself. Take that seriously. A description with no quantity in it is the usual reason this form comes back.

One thing it won't do is put labor hours in that box. Estimates price labor by the hour, and hours are not an amount of asbestos.

Save, and the finished PDF is filed against the job under OPP. A blank copy of the form is linked there too, if you'd rather complete one by hand.

Change orders

Requires estimator level or above.

When scope changes on site, record a change order against the job with a description, a reason, and an amount. It starts as **pending**.

Once approved, the amount rolls into the job's final value automatically. A negative amount records a credit and reduces it. The job's contract amount stays as originally agreed, and the change order total is tracked separately, so you can always see what was agreed at the start against what the job became.

Technicians cannot create or approve change orders.

Materials used

Record what was actually consumed on site: material name, quantity used, and unit. If you supplied an estimated quantity, a variance badge shows how far actual differs from estimate, highlighted when it exceeds ten percent.

Technicians can record materials but do not see or set cost. Enter what was used and the office adds cost afterward.

Material variance is one of the more useful numbers in the system. Consistent overruns on a material usually mean the estimate template needs revisiting rather than that the crew is wasteful.

Completing a job

Complete walks through the closing checklist. Depending on configuration, completed jobs may enter a review queue before invoicing.

11. Invoices and getting paid

Not visible to technicians.

Invoices are raised against completed jobs. The invoice records what was billed, what's been paid, and what remains.

Payment status is worked out from the job's own dates rather than being set by hand, so it can't drift out of step with reality. Deposit received, final invoice raised, and final payment received each move the status along.

Customers can be sent a link to view and pay an invoice online. See [What your customers see](#).

12. Messages

Messages is the SMS conversation view, threaded per customer. **Delivery Log** shows what was sent, when, and whether it arrived.

A few rules the system enforces regardless of what you type:

- **Consent.** Customers who haven't opted in are not texted.
- **Opt-out.** A customer who replies STOP is opted out immediately, of everything, including appointment reminders. START opts them back in. This is handled automatically.
- **Quiet hours.** If your administrator set quiet hours, messages aren't sent outside them.

Messages may carry a short brand prefix in square brackets so customers know who is texting.

13. Compliance

Regulatory notifications, permits, and crew credentials. Credentials track expiry, and depending on configuration the system can warn or block when assigning someone whose certification has lapsed.

Keep credential records current. An expired certification discovered during an inspection is a much more expensive problem than one discovered here.

Occupant Protection Plans are produced from the job itself rather than from here. See [Jobs and Work Orders](#).

14. Calendar

Scheduled surveys, jobs, and appointments in one view. The CRM has its own calendar scoped to sales activity.

15. What your customers see

Customers don't sign in. They receive links that open a single page.

- **Proposals.** The customer reads the proposal and signs it online. The signature, name, and timestamp are recorded against the estimate. You can see when they first opened it, which is useful before chasing.
- **Invoices.** The customer views the invoice and pays online where payment is configured.
- **Feedback surveys.** After a job, customers can be asked to rate the work. Responses appear under **Feedback**.

These links are private and specific to that customer and document. Treat them like a password: don't post them anywhere public.

16. Working offline

The mobile survey tool keeps working when signal drops. Survey progress is held on the device and photos queue for upload, syncing when you're back in coverage.

Two practical points:

- **Finish the survey before you leave the site.** Filling gaps from memory in the truck is where errors come from.
 - **Check the photos uploaded** before you consider the survey done. The photo step shows outstanding uploads.
-

17. Common questions

I can't see Estimates or Invoices in my menu. You're most likely a technician. Financial screens are hidden from field crew by design. If your job requires them, your administrator can change your role.

I can't submit my week. Something is still clocked in. Clock out of every entry, then submit.

The customer says they never got the proposal. Check the estimate for when it was first viewed. If it was never opened, resend it and confirm the email address. Check junk mail with them.

A survey won't submit. The review screen lists what's blocking it. It won't be Environment or Photos, which are optional. It's most likely a missing state or building type on Property, an unanswered Access question, or no documented area under Areas & Hazards.

I texted a customer and nothing sent. Either they haven't opted into SMS, they've replied STOP at some point, or you're inside quiet hours. The delivery log will say which.

I changed an estimate and the customer is quoting a different price. Check the version history. They may be looking at an older version. The active version is the one the system treats as current, and older ones stay readable precisely for this conversation.

Something looks wrong with a number. Don't correct it by editing around the system. Tell your administrator what you expected and what you saw. Job totals, change orders, and material variance are calculated, and a number that looks wrong usually means an input needs fixing rather than the total.
